Introduction to Slewing Mobile Crane (up to 100 tonnes)

What is a slewing mobile crane

A slewing mobile crane is a powered crane which features a boom or jib that can slew from front to back. The crane is mounted on a vehicle.

Slewing mobile crane

Crawler crane

Rough terrain slewing crane

This learner resource does not cover front-end loader, backhoe, excavator or similar equipment when configured (arranged or set up) for crane operations.

Parts of a slewing mobile crane

Element 1 – Plan work /task

What is a lift plan?

A lift plan is a document that outlines the size of a load, weight, dimensions, center of gravity, resources needed for lift, sling equipment list and a hazard risk assessment. The following is a sample template of a lift plan.

Lift Plan

1. Project Details:		Version No:				
Candidate Name:		Site Pick up address:				
Operator Contact Details / Supervisor		Site Drop off Address:				
Crane make / model		Crane ID				
Lift 1 Description

* Operator to Calculate / Sling Calculation						
2. Equipment for load lift / sling						
Dogger/Assessor initial						
3.* Sling Calculation Notes:						
4.^ Risk Controls: See additional note template.						

5.^ Sketch

For one of your lifts you will need to sketch the environment and any obstacles present.

Sketch one load and show the following:

1. Crane standing position
2. Stabiliser location
3. Load location
4. Show distances and load movement-direction
5. Any obstacles

Outriggers and packing (continued)

The base layer of packing should be closely laid and at least 75 mm thick

The packing should be pigstyed. This means each layer is at right angles (90° degrees) to the next.

The top layer of packing must be at right angles to the direction of the outrigger beam and at least 200 mm wide.

Packing, outriggers and jacks should be checked regularly during an operation.

Why you need packing

You **must** use packing under the outriggers. Each outrigger takes some of the weight of the crane and the load. Packing spreads that weight over a larger area. You must work out the minimum area of packing needed under each outrigger. This will keep the crane stable.

Packing spreads the weight

No packing

If you **do not** use packing the outriggers could sink and the crane could tip over.

How soil types affect packing

The type of ground you are working on changes how much packing you need.

For example, if you need to set up on soft clay you will need more packing than if you are setting up on shale or rock. The three best ground types are hard rock, shale or sandstone, and compacted gravel with up to 20% sand.

Packing formula

To calculate the area of packing needed in square metres you must know:

- The cranes mass (Cm)
- The loads mass (L)
- The bearing pressure of the soil (P_{MAX}).

$$\text{Area} = \frac{(\text{Cm} + \text{L}) \times 0.65}{\text{P}_{\text{MAX}}}$$

OR

$$\text{Area} = (\text{Cm} + \text{L}) \times 0.65 \div \text{P}_{\text{MAX}}$$

In this formula:

Cm = Crane mass

L = Load

P_{MAX} = Soil bearing pressure

Remembering this formula

It is much easier to understand this formula if you know what each part of the formula does.

Find the load on each outrigger

You should start by working out the top section. This part works out how much weight each outrigger will support. This is calculated on 65% of the total load.

$$\text{Area} = \frac{(\text{Cm} + \text{L}) \times 0.65}{\text{P}_{\text{MAX}} \text{ (Soil bearing pressure)}}$$

(Crane mass + Load weight) × 0.65 = Amount of weight on 1 outrigger

For example, if the crane weights 8 tonnes
and the load weighs 2 tonnes:

$$8 \text{ t} + 2 \text{ t} = 10 \text{ t}$$

$$10 \times 0.65 = 6.5 \text{ t}$$

Each outrigger will support 6.5 tonnes

Element 2 – Prepare for work /task

Risk assessment – Used to identify hazards

Shown here is an example of a risk assessment and control form.

You can use it at your workplace to help with risk management.

You can find out more about risk management in codes of practice available from –

Safe Work Australia
www.safeworkaustralia.gov.au

or from your state or territory regulator.

Example of a Risk Assessment and Control Form

Workplace area or grouping:		Reference no:				
Form completed by:		Date form completed:

Hazard:						
Associated risk:						
Specific circumstances relating to the risk:						
Persons at risk:						
Risk Assessment						
Existing control measures (if any):						
Likelihood:	<input type="checkbox"/> Almost certain	<input type="checkbox"/> Likely	<input type="checkbox"/> Possible			
	<input type="checkbox"/> Unlikely	<input type="checkbox"/> Rare				
Consequences:	<input type="checkbox"/> Catastrophic	<input type="checkbox"/> Major	<input type="checkbox"/> Moderate			
	<input type="checkbox"/> Minor	<input type="checkbox"/> Insignificant				
Risk Control						
Possible control options:						
Elimination:						
Substitution, Isolation or Engineering:						
Administrative or Personal Protective Equipment:						
Preferred control options (and why):						
Implementation Plan						
Control option	Associated activities	Resources required	Person(s) responsible	Proposed implementation date	Sign off and date	Scheduled review date
Review						
Are control measures in place?		<input type="checkbox"/> Yes	<input type="checkbox"/> No	Why not?		
Are controls preventing or minimising the risk?		<input type="checkbox"/> Yes	<input type="checkbox"/> No	Why not?		
Are there any new problems with the risk?		<input type="checkbox"/> Yes	<input type="checkbox"/> No	What are they?		

Hazard - Too dark

You must be able to see clearly. Ask your boss to have the area properly lit up. They may need to set up temporary lighting while you work.

Hazard

If the work area is dark or dimly lit you might not be able to see clearly.

Control

Use extra lighting such as portable lamps, or try to find a brighter area if you can.

Methods of not endangering ones self while slinging a load

To prevent harm on one’s self and others, you would need to identify hazards and use appropriate risk controls while slinging a load.

Hazards that can be found with slinging a load can be;

- Sling hazard 1. **Sharp edges on load,**
- Sling hazard 2. **Wear and tear on sling equipment,**
- Sling hazard 3. **Load In-balance,**
- Sling hazard 4. **Incorrect use of equipment that makes up sling configuration**
- Sling Hazard 5. **WLL. – Incorrect reading of working load limits and calculations of load to become unstable or drop load.**

A risk assessment for slinging a load.

Company Details: Easy Guides Australia (EGA Earchworks – 19 Chandler Road, Boronia Vic 3155) Date: 12/12/ Contact:

Work Description: Lift a load, concrete drainage 12 meters long, 4.5 tones in mass, using a web sling with a spreader beam and basket hitch.

Hazard Item	Likelihood / Risk Level	Consequences / Likelihood	Control options or protection measures	Control options			4. preferred control options	5 use ppe
				1. Elimination	2. Substitution	3. Administrative		
1	1 = low	Could - Cause load to fall	Use protective material around sling to prevent break and damage to sling	Yes	Yes	Yes - have an equipment checklist	See notes	N/A
2	1 = low	Possible - Could cause sling to fail or break	Use protective equipment when sling and store in a safe environment.	Yes	Yes	Check equipment for faults and not use and use new equipment	See notes	N/A
3	2 = moderate	Could - Cause load to fall	Use a Leveler when testing lift to en sure load lift to destination will stay the same level and load is balanced, ensuring center of gravity.	Yes	Yes	Use a leveler or a tennis ball and see if it does not fall or move.	See notes	N/A
4	2 = moderate	Could - Cause load to fall	Have a supervisor review you sling configuration hook,	Yes	Yes	Yes - Supervisor check. Use different conf	See notes	N/A
5	3 = High	Likely - sling line or sling to break and load to fall	Remove any hazards such as people and direct people around load area. Use a spotter to monitor lift of load, on the ground with communication such as walkie talkie to lift operator. Double check WLL calculations with Supervisor.	Yes	No	Yes	See notes	N/A

QUESTION 91

What should the angle between the first (bottom) and second (top) layer of pigstyting be?

The angle should be 90 degrees between layers of pigstyting.

QUESTION 97

You are looking at the load chart. The chart has a thick black line near the middle.

What do the numbers **above** and **below** the line mean?

The numbers **above the line** tell you the structural strength of the crane.
The numbers **below the line** tell you how stable the crane is.

CRANE LOAD CHART

QUESTION 102

How can you find out the load rating when the fly jib is set up?

Check the load chart or the angle of the jib.

QUESTION 103

You have entered all the information into the computer.

How do you make sure the computer is working properly?

See if what the computer shows is the same as the load chart.

Note: Check the manufacturer's instructions for testing

QUESTION 104

You have done your post operational checks. You are about to lift a load.

Why should you test your communication equipment?

To make sure you and the dogger can hear each other.

READING LOAD CHARTS

FOR CRANES UP TO 100 TONNES

Load Chart - 100 Tonne (A)

WARNING

1. Boom backstops are required for all boom lengths.
2. Gantry must be in a rated position for all operating conditions.
3. Boom inserts must be arranged as shown in the 'Boom Insert Arrangement Chart'.
4. Mid-point suspension (centre hitch) required when boom length is 55.5m or longer.
5. Safe loads depend up on ground conditions, boom length, radius of operation and proper handling. All of which must be taken into account by the user.
6. Standard boom hoist reeving is 12 parts line.
7. Ratings are based on trawler extended to full jibs point. Crawler frames must be fully extended for all crane operations.
8. For main boom ratings, with jib erected not shown, use rating for next longer boom.

Load chart

All cranes have their **own** load chart. They should be in place and readable. The load chart gives information about the load capacity of the crane in a given configuration (set up). The crane's capacity changes depending on how the crane is set up.

Configuration

The configuration of the crane includes things like:

- The outrigger set up (if applicable)
- The length and angle of the main boom
- Operating radius
- Maximum line load and winch capacity
- Fly jib and hook attachments.

Important information

Other important information may include:

- Limitations of boom angles
- Operational conditions. For example wind speed.

Crane set-up

A load chart refers to a crane that is set up:

- According to manufacturer's specifications
- On firm, level ground
- In ideal weather conditions
- With outriggers/stabilisers fully extended (where applicable)
- Tyres correctly inflated and in good condition.

Read all of the information on the load chart.

EXAMPLES OF READING CRANE CHARTS

Note: The following crane chart exercises us the C1 LOAD CHART_LIEBHERR LTM1100-5.2 load chart. This is located in the 'Trainer's Resource' of the Easy Guides training material. Your trainer will provide you with this crane chart.

General Questions

a) What counterweight is fitted to the crane to allow it to have on-road axle weights of 12t?

Answer = 7t counterweight

b) What is the rated capacity of the 7-sheave hook block?

Answer = 55t

c) What is the tare weight of the 30.2t rated capacity hook block?

Answer = 260kg

d) The working radii on the LTM 1055 3.2 is measured from where on crane?

Answer = From centre of slew

Element 3 – Perform work /task

Do the lift

This part of the book is about how to do a lift.

It covers:

- Positioning the hoist block and boom/jib
- Test lifts
- Moving and watching the load
- Safe crane operation
- Responding to unsafe situations
- Checking the planned route.

Conduct a test lift

With some loads it can be difficult to establish where the load's centre of gravity is. Sometimes the only way to be sure that the load will be stable while moving is to perform a **test lift** to see if it stays stable.

Test lift

Do a test/trial lift before you use the crane to move a load. This helps you check:

The crane can do the lift. You do not need to lift the load far off the ground to check that it is stable.

You need to confirm the weight of the load.

- Outriggers/packing are secure
- All crane equipment works properly

- Lifting slings/chains have been positioned correctly for even weight distribution
- Make sure the load is secure.
- Make sure the crane is stable.
- Check that crane functions are working.

There is enough clearance for the boom movement

QUESTION 181*...CONTINUED FROM PREVIOUS PAGE*

You are operating a crane and:

The derrick touches the hook and jumps like they are getting a shock.

or

Your crane contacts overhead powerlines.

What must you do?

When you get to the ground, move away from the crane by **hopping** or by **shuffling with both feet together**.

Do not run or walk because the ground might be electrified.

Get to at least **8 metres** away from the crane or plant you are operating..

*...CONTINUES ON NEXT PAGE*

QUESTION 181

...CONTINUED FROM PREVIOUS PAGE

You are operating a crane and:

The dogger touches the hook and jumps like they are getting a shock.

or

Your crane contacts overhead powerlines.

What must you do?

When you get clear of the crane, warn everyone else to stay at least 8 metres away from it.

Do not touch any person getting an electric shock or touch electric lines.

...CONTINUES ON NEXT PAGE

QUESTION 181*...CONTINUED FROM PREVIOUS PAGE*

You are operating a crane and:

The dogger touches the hook and jumps like they are getting a shock.

or

Your crane contacts overhead powerlines.

What must you do?

Do all the incident reporting that you should.

Do any first aid you need to.

Do not use the crane until it has been checked out.

QUESTION 182

Something happens that can make the crane or load unsafe.

What must the operator do?

You need to:

Stop using the crane, look at what is unsafe

Try and fix the problem

Ask for help or assistance

Report as per site procedures.

QUESTION 183

Some of the Australian standard signals used in dogging are shown here.

What does each of these signals mean?

Hoisting raise

2 short

Hoisting lower/down

Commonly used signal (not Australian Standard)

1 long

Luffing boom up

3 short

Luffing boom down

4 short

...CONTINUES ON NEXT PAGE

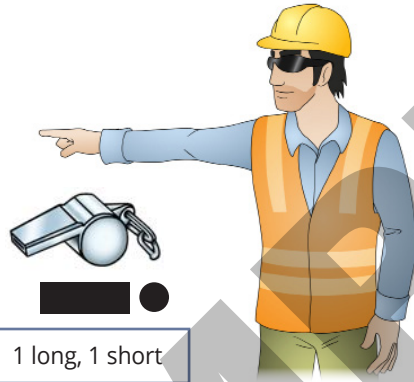

QUESTION 183

...CONTINUED FROM PREVIOUS PAGE

Some of the Australian standard signals used in dogging are shown here.

What does each of these signals mean?

Slew left /Travel left

Slew right /Travel right

Jib in /Trolley in

Jib out /Trolley out

...CONTINUES ON NEXT PAGE

QUESTION 183*...CONTINUED FROM PREVIOUS PAGE*

Some of the Australian standard signals used in dogging are shown here.

What does each of these signals mean?

Travel and traverse

Indicate the direction you want the crane to go

Not applicable

**Stop**

1 short

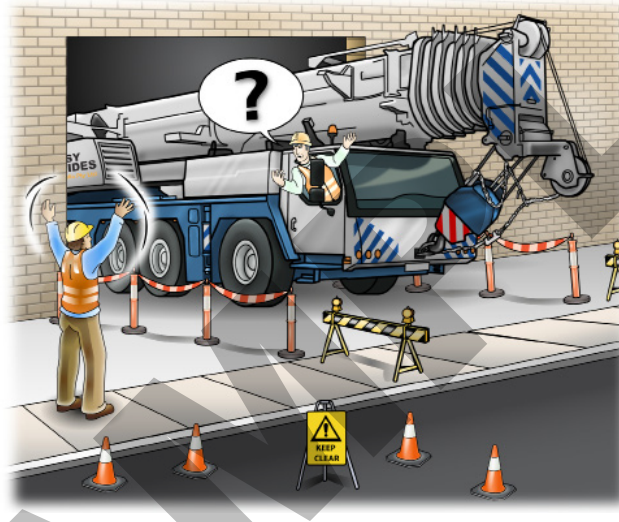

QUESTION 184

A workmate gave you a signal and you didn't understand it.

What should you do?

Stop operating the crane and ask your workmate to repeat or explain the signal.

Also, who or what person would you follow directions from when lifting a load, either from hand, whistle or radio?

You would follow directions of dogger or rigger or even another work mate. But when operating the crane you would follow the directions of the dogger or rigger.

...CONTINUES ON NEXT PAGE

QUESTION 184*...CONTINUED FROM PREVIOUS PAGE*

What is the role of the dogger man?

The reason why we monitor a load and its crane movement is to ensure safe operation of tasks to be performed.

What sequence of hand signals would you use to tell the crane operator to stop and make adjustments to the crane lift?

One role from many others of a dogger man is to monitor the movement of the crane and its load.

What sequence of hand signals would you use to tell the crane operator to stop and make adjustments to the crane lift?

So that, the load can be lifted up by 2 meters and swing to the right of the vehicle because a tree branch fell and caused a major hazard.

**Stop****Luffing boom up****Slew right /Travel right****Lower**

QUESTION 185

You are releasing a heavy load from the crane hook.

How do you control boom deflection?

Lower the boom/jib slightly as the load settles on the supporting surface before lowering the hook.

- This releases some tension (force) from the slings
- This stops the boom/jib from springing upwards when it is released.

When unhooking a load, make sure controls are not active to safe guard from boom deflection and monitor crane movement for safety.

Element 4 – Pack up

Shut down and pack up

This part of the book is about how to shut down, pack up and put away equipment.

It covers:

- Stowing and securing equipment
- Using motion locks
- Shutting down the crane
- Post-operational checks.

Stow boom/jib and equipment

Stow your boom as shown in the manufacturer's instructions or the specifications.

Remove any lifting parts from the boom and securely attach them to the correct position on the vehicle.

Apply motion locks and brakes

When shutting down the crane or leaving it unattended, check that you have turned on all motion locks and brakes.
